

Job Search

A short guide for Codex and Claude Code

Your AI helps organize the search.
You review the facts and documents.

[Open the GitHub guide](#)

1. Open your AI app

Choose one desktop app and sign in.

Codex

Download the ChatGPT desktop app, then choose Codex inside it.

[Mac download page \(Apple Silicon\)](#)

[Windows download page](#)

Claude Code

Download Claude, then open Code and select Local.

[Mac or Windows downloads](#)

[Claude Code setup and account requirements](#)

Already installed? Continue to your project. Labels and availability can vary by version.

a. Choose your project

In Codex, click Choose project above the message box.

Choose an existing job-search project, or create a new one.
Use a dedicated folder such as My Job Search.

b. Select or create your folder

In Codex Create project:

Enter My Job Search.

Under Source folders, click Add.

Select your folder, then click
Create project.

Need a new folder?

Create it in Documents using
File Explorer or Finder first.

A screenshot of the 'Create project' dialog box in Claude Code. The dialog has a dark background and a title bar with a close button. It features a 'Project name' input field with a folder icon on the left. Below this is a section titled 'Source folders' which contains a large rectangular area with the text 'Add a folder on this computer' and a downward arrow. At the bottom of this area is an 'Add' button with a folder icon. At the bottom right of the dialog are two buttons: 'Cancel' and 'Create project'.

Claude Code: Local, then Select folder.

c. Codex: Full access

Click the permission label below your message.
Select Full access, as shown.

Full access allows internet and file access across your computer, including files outside the selected project.

d. Claude Code: Auto

Click the mode label below your message. Select Auto.

Claude handles permission decisions with background safety checks.
Some actions can still require your input.

2. Your resume

If you have one

Attach your PDF or Word file before sending the first message.
If attachments are unavailable, paste its full file location.

If you do not have one

Add: “I do not have a resume yet. Help me build one.”

Add your LinkedIn URL too. The AI can reconcile profile details with your records.

3. Your first message

Copy both lines into the same message box as your resume:

**Install <https://github.com/toughdave/job-search> for this project.
Then use job-search to start my search.**

Add your resume location or no-resume sentence if needed.
Press Send once. Follow any installation approval or restart request.

[Copy from the README](#)

4. A short conversation

The AI asks about one employer and role at a time.

Example: Cedar Clinic, Office Assistant, 2022-2024

“At Cedar Clinic, tell me about one scheduling problem you handled as an office assistant.”

Explain what you did and what happened. Honest qualitative results are useful. The AI asks only for missing details.

LinkedIn review follows the fuller interview. Public edits need your approval.

Your weekday morning search

- a. Review the job titles and search sites the AI suggests.
- b. Choose a schedule. The starting suggestion is weekdays at 9 a.m. in your confirmed timezone.
- c. Let the AI save the instructions and set up the task.
You can change the time or keep searches manual.

Keep your computer awake and the desktop app running for local searches.

Review and change your routine

Codex desktop: Scheduled

Claude Code Desktop: Code → Routines

The AI checks unfinished applications and new listings, then prepares suitable drafts for your review.

“Move my daily search to 8 a.m.”

“Pause my scheduled search.”

[Read the daily-search guide](#)

5. Your first draft

When enough is known, the AI prepares useful documents and keeps your search records in a separate private location.

Open the files and check your experience, dates and contact details. Give corrections in the conversation.

“That role was volunteering. Please correct it.”

Review the employer and final documents before authorizing a submission.

Summon the installed skill

Codex / ChatGPT desktop

Type @ and choose job-search. If your composer offers a \$ skill picker, choose job-search there.

Codex CLI or IDE: \$job-search

Claude Code: /job-search

Add “Start my search” or “Continue my job search”, then send.
Use the AI message box after installation, in the same project.

If the picker cannot find it, send: “Use job-search.” Ask the AI to check installation if needed.

6. Next time

- a. Reopen the same local project and conversation.
- b. Summon job-search, then send:

Continue my job search.

- c. Continue from your saved progress.
Supply an updated resume when it changes.

For an independent occupation search, use a new project with separate records.

If something stops you

Skill missing?

“Check whether job-search is installed in this project and help me load it.”

Cannot save?

Check the selected folder and file permissions. Approve the specific access request if you want it to proceed.

New chat cannot find your records?

Provide the private records location the AI gave you. Say:
“Resume my existing search here; do not start over.”
